Amendments to the Claims:

Please cancel claim 10, amend claims 11, 13, 14, and 15-19 as indicated below and add new claim 20. This listing of claims will replace all prior versions and listing of claims in the application:

Listing of Claims:

- 1. (Previously presented) A circuit for generating a reference current, comprising:
- a positive feedback loop coupled with a floating current mirror; and
- a negative feedback loop diverting current from the floating current mirror,

wherein the circuit operates with a minimum supply voltage of approximately the sum of a transistor threshold voltage plus three drain saturation voltages.

- 2. (Previously presented) The circuit of claim 1, where the negative feedback loop diverts current directly from the floating current mirror.
- 3. (Previously presented) The circuit of claim 1, where the negative feedback loop diverts current from the floating current mirror by using a voltage follower.
 - 4. (Canceled)
- 5. (Previously presented) The circuit of claim 1, wherein the floating current mirror includes a pair of p-channel transistors.
 - 6. (Previously presented) A method for providing a current reference, comprising: providing a current mirror circuit portion;

providing a positive feedback loop portion coupled with the current mirror circuit portion;

providing a negative feedback loop portion diverting current from the current mirror circuit portion; and

operating the current reference with a minimum supply voltage of approximately the sum of a transistor threshold voltage plus three drain saturation voltages.

Appl. No. 10/796,859 Amendment dated April 19, 2007 Reply to Office Action of January 19, 2007

- 7. (Original) The method of claim 6, wherein the operation of providing the current mirror circuit portion includes providing a pair of p-channel transistors.
- 8. (Previously presented) The method of claim 6, wherein operation of providing the negative feedback loop portion includes diverting current directly from the current mirror circuit portion.
- 9. (Previously presented) The method of claim 6, wherein the operation of providing the negative feedback loop portion includes providing a control of a common voltage of the current mirror circuit portion.
 - 10. (Canceled)
 - 11. (Currently amended) A circuit providing a current reference, comprising:
 - a floating current mirror including a first transistor and a second transistor;
 - at least one resistor defining a voltage node;
 - a pull-down transistor coupled with the floating current mirror; and
 - an output transistor;

wherein the first transistor is coupled with the at least one resistor and provides an amount of current thereto;

wherein the second transistor is coupled with the output transistor for providing a bias signal to the output transistor;

wherein the amount of current provided by the first transistor into the at least one resistor is mirrored to the second transistor; and

wherein the pull-down transistor has one end coupled with the floating current mirror and a gate coupled with the voltage node, so as the amount of current provided by the first transistor increases, the pull-down transistor diverts an amount of current received by the first transistor.

- 12. (Canceled)
- 13. (Currently amended) <u>The circuit of claim 11, A circuit providing a current reference, comprising:</u>

Appl. No. 10/796,859 Amendment dated April 19, 2007 Reply to Office Action of January 19, 2007

a floating current mirror including a first transistor and a second transistor;

at least one resistor defining a voltage node;

a pull-down transistor; and

an output transistor;

wherein the first transistor is coupled with the at least one resistor and provides an amount of current thereto:

wherein the second transistor is coupled with the output transistor for providing a bias signal to the output transistor;

wherein the amount of current provided by the first transistor into the at least one resistor is mirrored to the second transistor; and

wherein the amount of current mirrored to the second transistor provides a bias signal to the output transistor.

14. (Currently amended) A circuit providing a current reference, comprising:

a floating current mirror including a first transistor and a second transistor;

at least one resistor defining a voltage node;

a pull-down transistor coupled with the floating current mirror; and

an output transistor;

wherein the first transistor is coupled with the at least one resistor and provides an amount of current thereto;

wherein the second transistor is coupled with the output transistor for providing a bias signal to the output transistor;

wherein the amount of current provided by the first transistor into the at least one resistor is mirrored to the second transistor; and

wherein the circuit operates with a minimum supply voltage of approximately the sum of a transistor threshold voltage plus three drain saturation voltages.

Appl. No. 10/796,859 Amendment dated April 19, 2007 Reply to Office Action of January 19, 2007

- 15. (Currently amended) The circuit of claim 11 [[10]], wherein the pull-down transistor is an n-channel MOSFET.
- 16. (Currently amended) The circuit of claim 11 [[10]], wherein the output transistor is an n-channel MOSFET.
- 17. (Currently amended) The circuit of claim 11 [[10]], further comprising:

 a protection transistor coupled between the pull-down transistor and the floating current mirror.
- 18. (Currently amended) The circuit of claim 11 [[10]], wherein the protection transistor is a p-channel MOSFET.
- 19. (Currently amended) The circuit of claim 11 [[10]], wherein a load is coupled to the output transistor, the load receiving the current reference.
- 20. (New) The circuit of claim 11, wherein the first and second transistors are p-channel MOSFETS.
